2022 Seed Treatment Offerings

Warden[®] CX By WINFIELD UNITED

Warden CX is an insecticide and fungicide seed treatment used to improve root health and plant vigor. It contains three fungicides for multiple modes of action against soil borne diseases including: Rhizoctonia, Pythium, Phytophthora, and Fusarium. Warden CX also includes an active ingredient from Cruiser insecticide that has exceptional protection against an array of seed and foliar feeding insects.

Warden[®] RTA[®] By WINFIELD

Warden RTA fungicide protects yields by defending the seed and young seedling from disease. The extra seed protection allows growers to plant earlier into cool and wet soil, helping to reduce the risk of replanting. Other benefits include: improved germination, enhance early-season vigor, and earlier canopy, for excellent return on investment.

PRIMO R1 A VERDESIA NUE SOLUTION™

Primo R1 is a concentrated soybean inoculant that helps provide soybean plants with the levels of nitrogen it needs. Using an inoculant helps your plants build a larger “nitrogen engine” to support greater yield potential. Primo R1 uses multiple strains of Rhizobia, allowing for more consistent performance.

Heads Up Plant Protectant is a preplant seed treatment for the prevention of fungal and bacterial diseases in soybeans including: Sudden Death Syndrome, Rhizoctonia Root Rot, and Sclerotinia White Mold. Heads Up uses the Systemic Acquired Resistance (S.A.R.) mode of action. When Heads Up is applied as a seed treatment it enables the germinating seed to inhibit the attacking disease through its own naturally occurring defense mechanisms.

Vault[®] SP BASF We create chemistry

Vault SP is a dry soybean inoculant that delivers very high counts of nitrogen-fixing rhizobia in a sterile peat carrier that is easy to apply and offers proven results. Vault SP is applied directly to dry seed and provides excellent seed coverage with easy planter box application.
